CC6-IC04 · PASSWORDLESS AUTH

Sign in without a password

What we're building first, and why

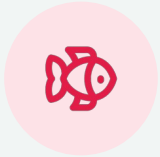

Passwords are the weak spot

Reused

One leak opens many doors

Phished

Fake pages look real

Leaked

Breaches spill millions

SMS codes

SIM swaps steal them

So let's get rid of them.

Your device becomes the key

Pick your device

Phone, laptop or security key

Unlock it

Fingerprint, face or PIN

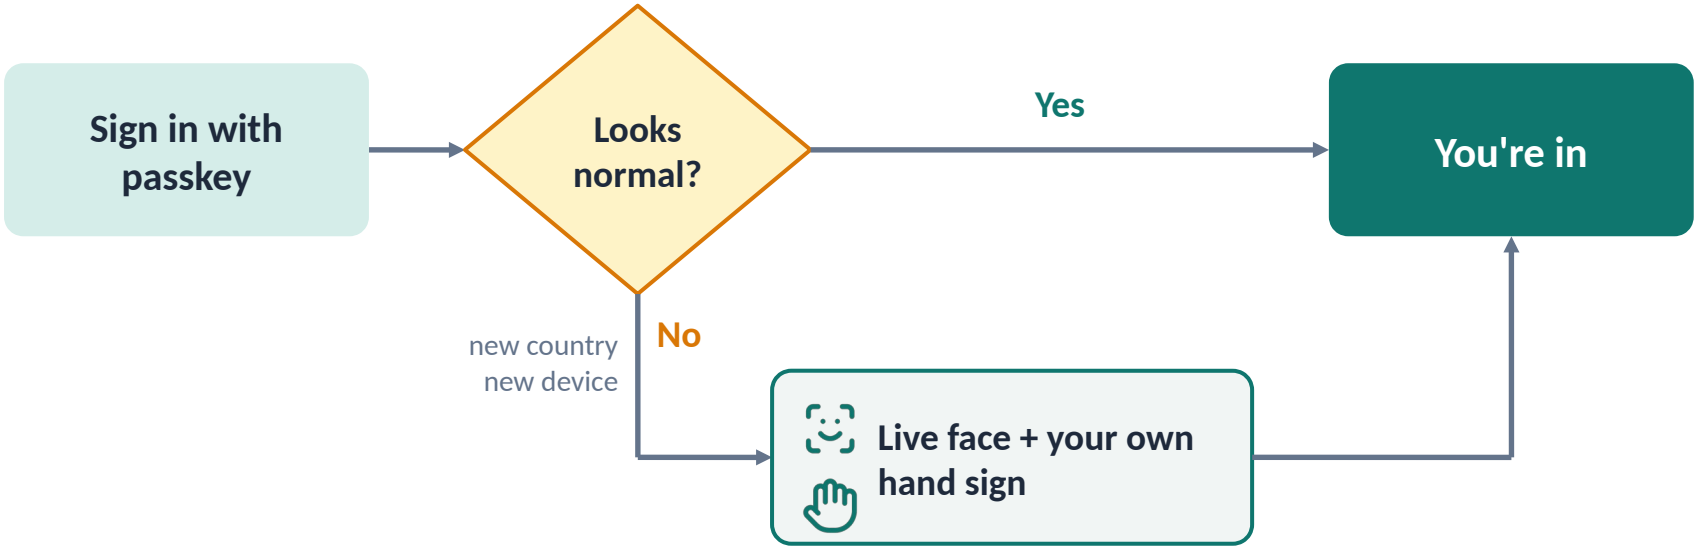

You're in

Nothing typed, nothing to steal

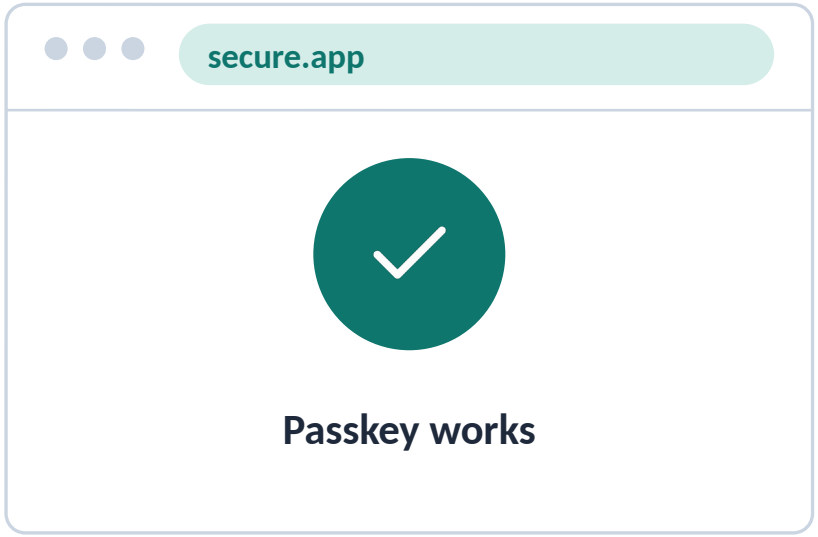

Built on passkeys (FIDO2 / WebAuthn). The secret key never leaves your device.

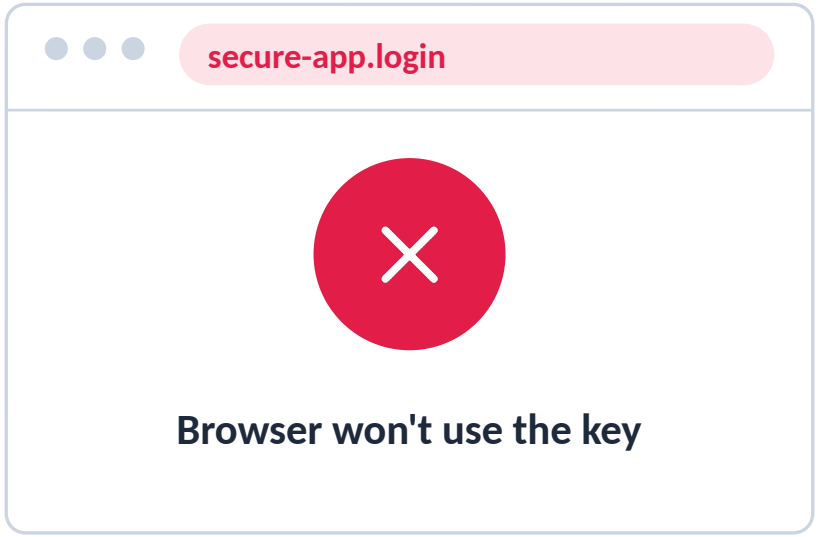

Something looks off? Show us it's you

A second lock, never the only one.

A fake site gets nothing

A passkey is tied to the real web address. A look-alike page has nothing to steal.

Lost your phone? You can still get back in

Recovery code
Saved at sign-up

Live face check
Proves a real person

Short wait
Your other devices can cancel

New passkey
Back in, safely

No password. No SMS. No single thing an attacker can fake.

Built for real life

Add a device

Scan a QR with a phone you trust

Lost one? Remove it

Its key stops working right away

Voice prompts

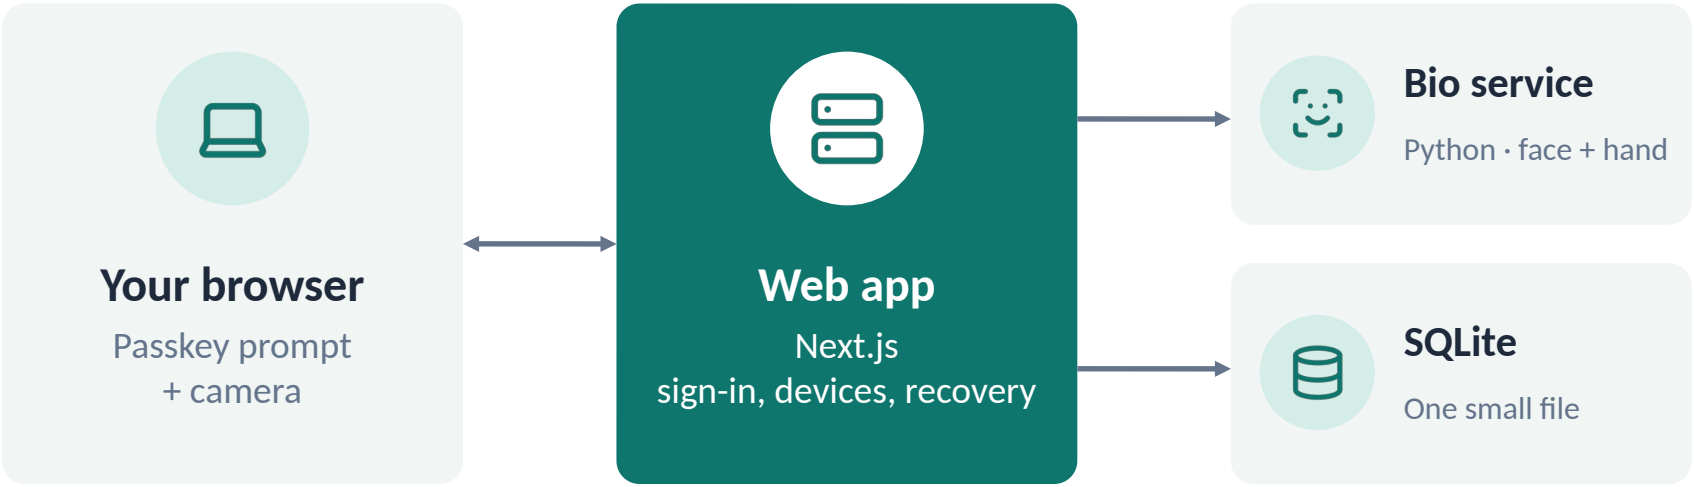

Every step can be read aloud

Admin view

Devices, logins, revoked keys

How it fits together

Checks happen on the server, never in the browser. Face photos are never stored.

Phase one: what we build first

Four tracks built side by side, then stitched together for one end-to-end demo.
