CC6-IC04 · PASSWORDLESS AUTH · PHASE TWO

Sign in without a password

Built, working, and shown live

Every requirement is built and working

Passkey login
No password, ever

Phishing-proof
Fake sites get nothing

Safe recovery
Code + face, no SMS

Multi-device
Add by QR, remove lost

Risk check
Odd login? Extra check

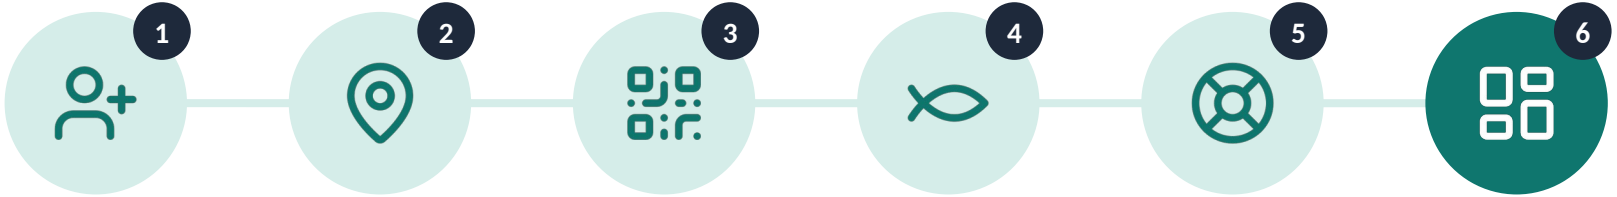

Inclusive
Voice, QR, security keys

Admin view
Devices, logins, revoked

Our USP
Live face + your hand sign

Plus all three deliverables: the end-to-end app, a live phishing demo and a written threat model.

The demo in six steps

Sign up
Passkey, face and your hand sign

Risky login
New country triggers a check

New device
Scan a QR, approve, done

Phishing
Every attack fails

Recovery
Lost phone, back in safely

Admin
Everything in one view

Running live now. The next slides walk through each step.

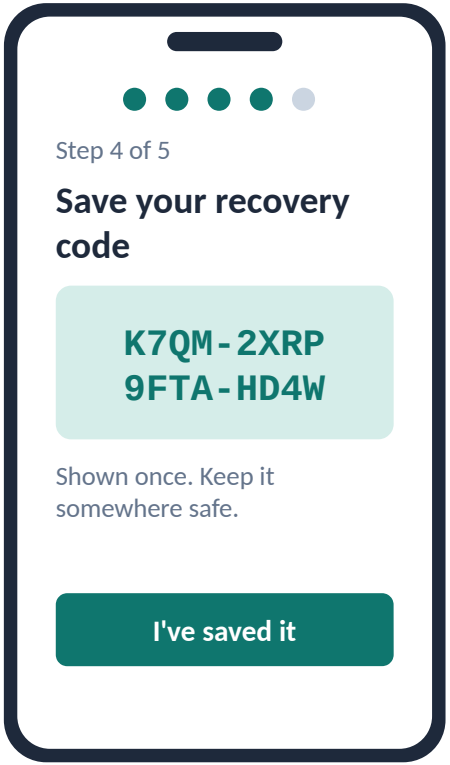

Sign up in under a minute

1. **Pick a name**
   No email, no phone number

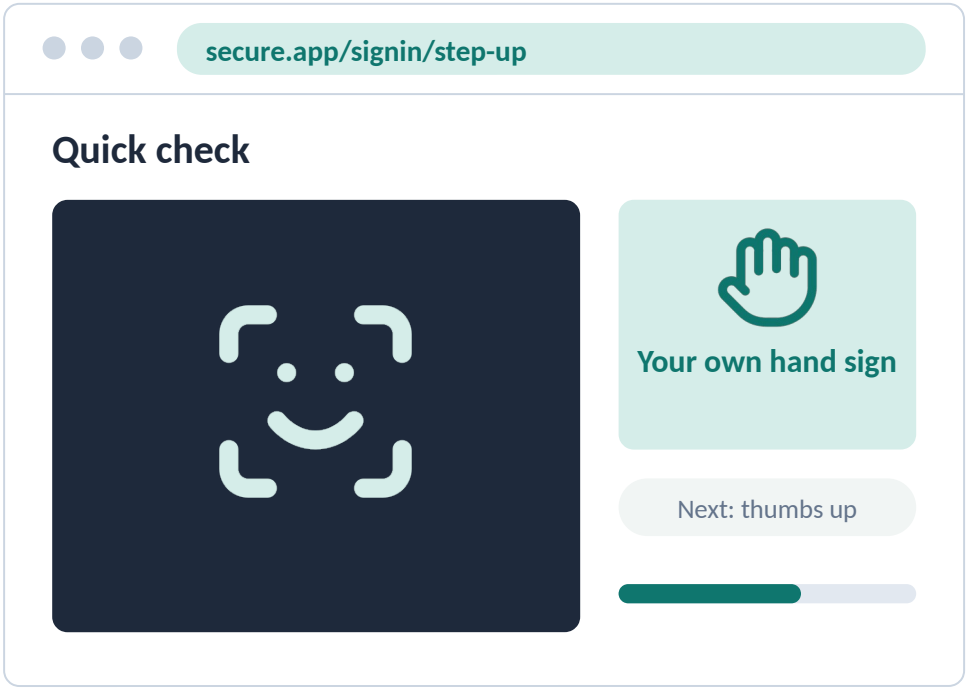

2. **Create a passkey**
   Fingerprint, face or PIN on your device

3. **Show your face + your own hand sign**
   Any hand shape you like becomes yours

4. **Save your recovery code**
   Your way back if every device is lost

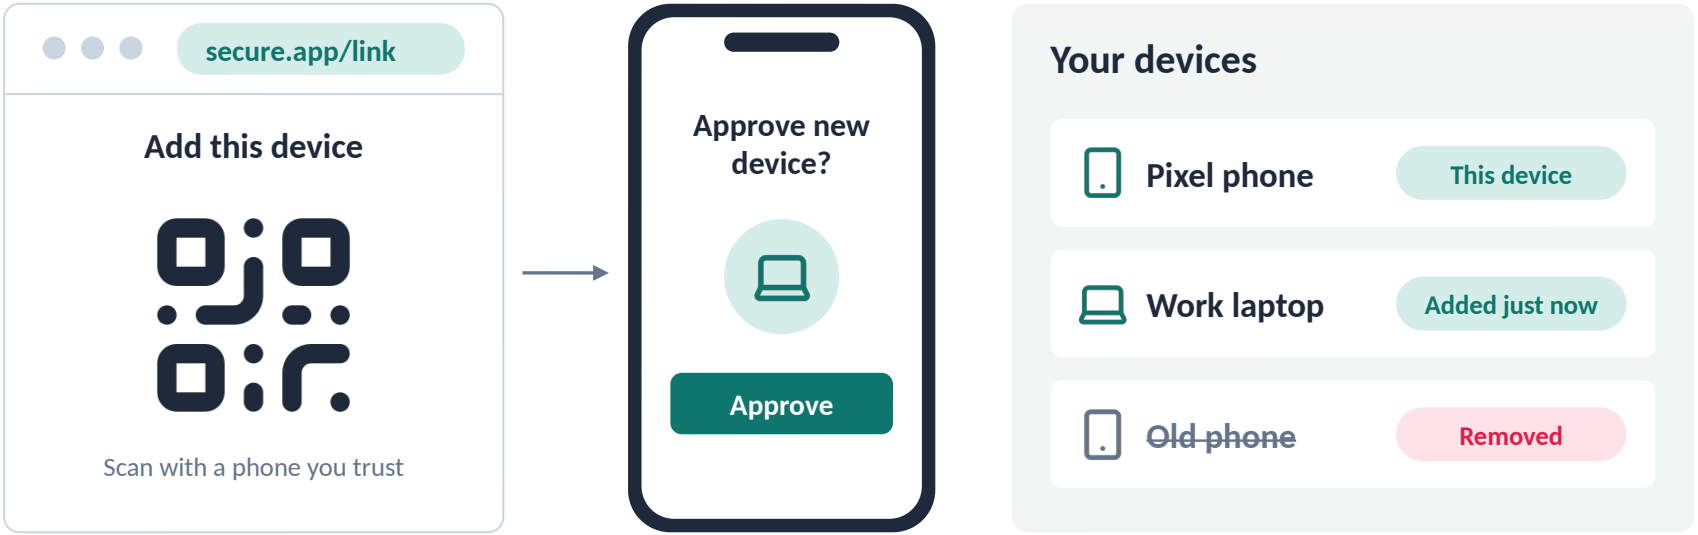

Unusual login? Show us it's really you

Live you	Passes
Printed photo	Fails
Replayed video	Fails

Your own sign + one random sign, in a new order every time.

Add a new device. Lock out the lost one

Removing a device needs a fresh unlock. Its key and sessions stop working at once.

We attacked our own app. Every attack failed

Ask for the real site's passkey	Browser refuses
Use the fake site's own passkey	Nothing to use
Steal the key, fake the web address	Server rejects it
Relay the face check	Needs a real login

Same trick on a password + OTP site

The fake page captures both, in plain text, and can use them right away.

A look-alike site on a different address. The blocked attempt shows up in the admin view.

Lost every device? Still a safe way back

Recovery code + live face check

No password, no SMS

Your other devices get an alert

One tap cancels it

After the wait, a new passkey

Old keys signed out, new code issued

Account recovery in progress

Not you? Cancel it now. Your passkeys keep working.

Cancel recovery

24 h

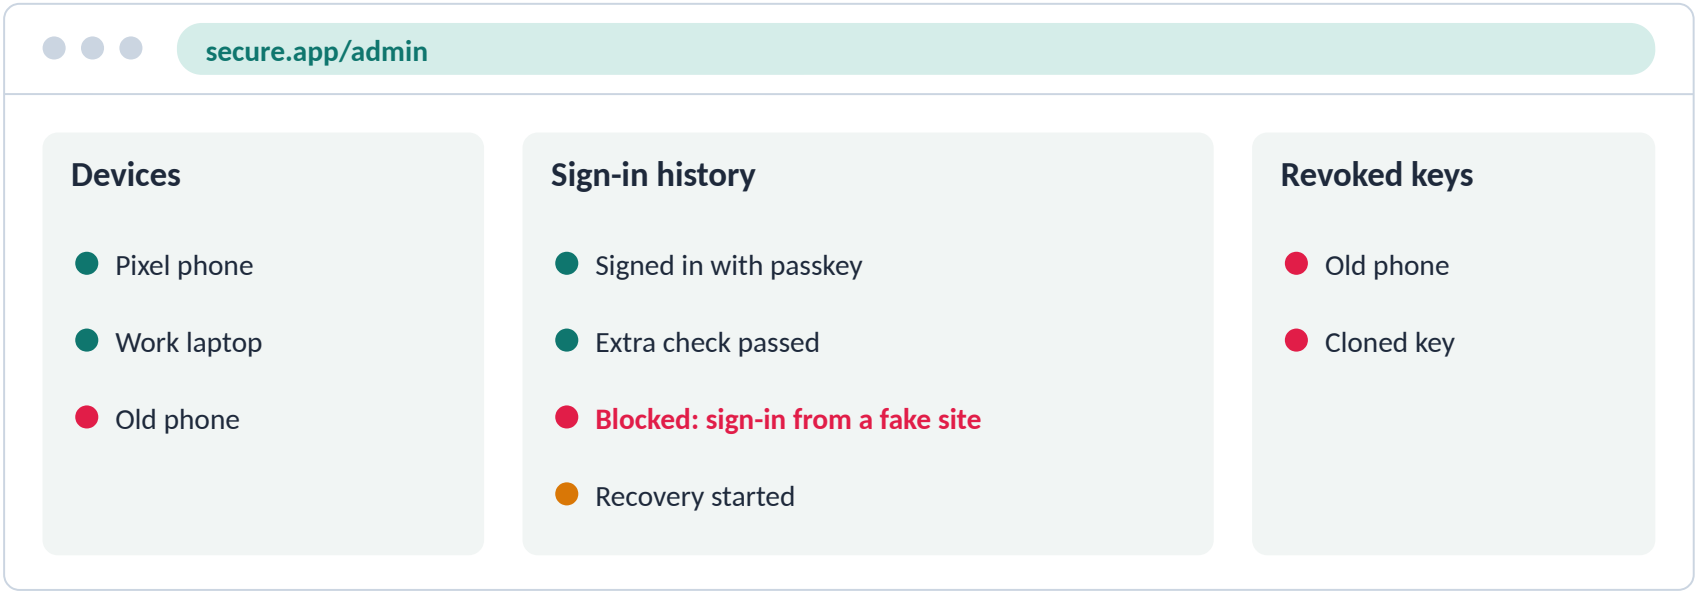

wait with face check

72 h

wait with code only

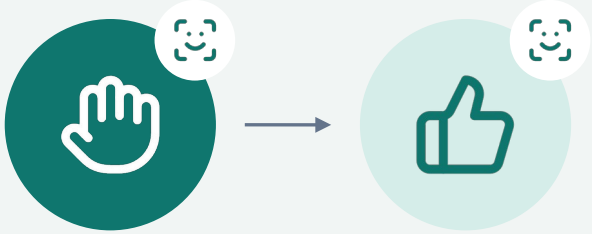

The wait gives the real owner time to stop a stranger. Shortened to a minute for the demo.

One screen for the admin

Every login, device change and blocked attempt is logged, and the log can't be edited.

Why our hand-sign check is hard to fake

Order shuffles every check

Your own sign
A shape only you picked

Plus a random one
Old videos can't follow new prompts

Same face the whole time
Hand next to your face, no splicing

Checked on our server
Photos never stored, template encrypted

A second lock on top of the passkey, never a login on its own.

Easy for everyone, not just power users

Voice prompts

Every step can be read aloud

QR from a trusted phone

Sign in a new device, no typing

Security key or card

For people without a smartphone

Small screens

Works on 360 px wide phones

Plain words on every screen. No codes to read, copy or type.

What we stop, and what we don't (yet)

Stopped

- Phishing and look-alike sites
- Leaked or reused passwords
- SIM swaps and OTP theft
- Photo or video replay
- Lost, stolen or cloned devices
- Recovery takeover attempts

Honest limits

- Live deepfakes: harder, not impossible
- Malware on the user's own device
- Face model not certified for production

Full threat model is part of the app, on a printable page.

Where it stands, and what's next

0 passwords or OTPs stored

4 / 4 phishing attacks blocked

7 / 7 requirements working

Next steps

- Tune the face and hand checks with more people
- Add an anti-spoof model for screens and masks
- Hindi and regional-language screens
- Email alerts for recovery
- Deploy on a real domain

Built on open standards (FIDO2 / WebAuthn): works with the phones and laptops people already own.

THANK YOU

Nothing left to phish

No passwords. No OTPs. Questions?
